

The System Information panel has always been a great way to get more information about your system, but in Windows 8 you will have a hard time figuring out how to open it. Here's how to do it.

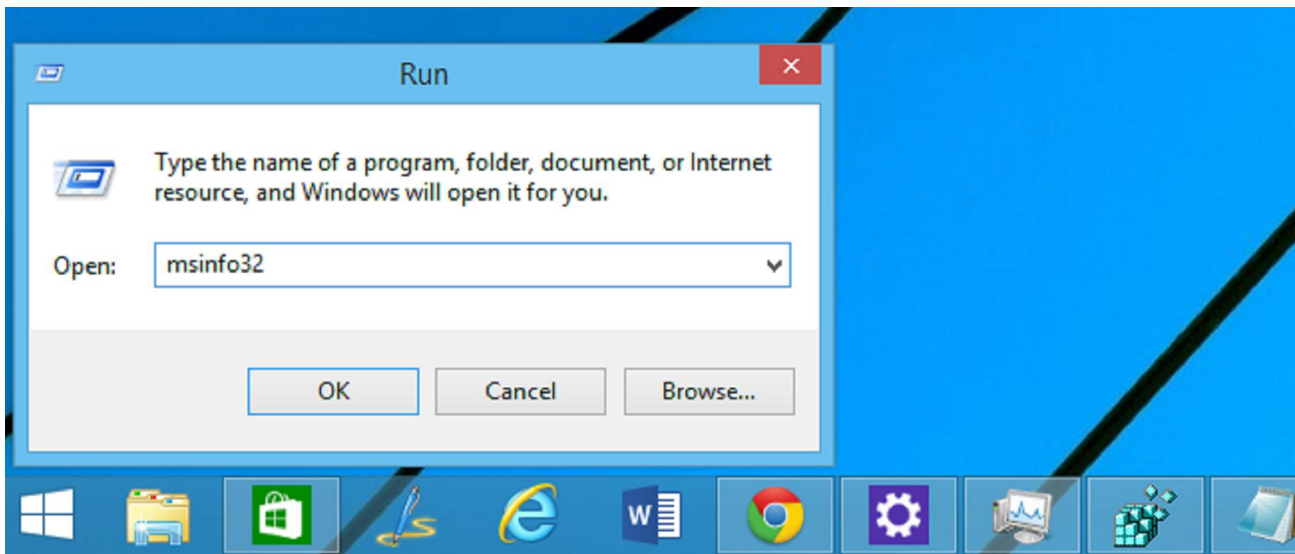

First, you'll need to right-click on the Start button and choose Run to bring up the Run dialog (of course).

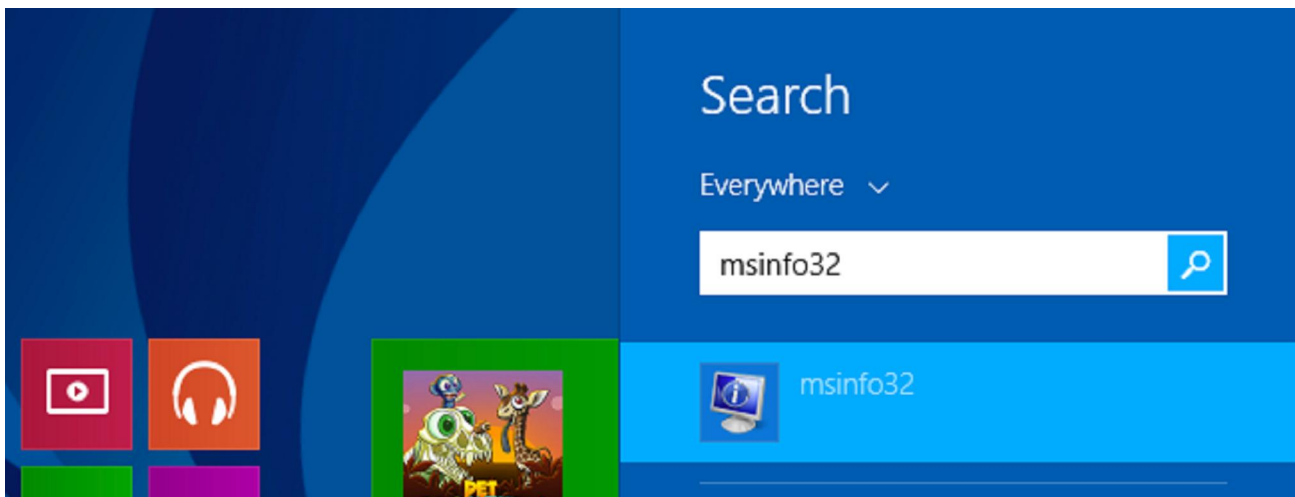

And then you'll need to type the following into the Run box:

`msinfo32`

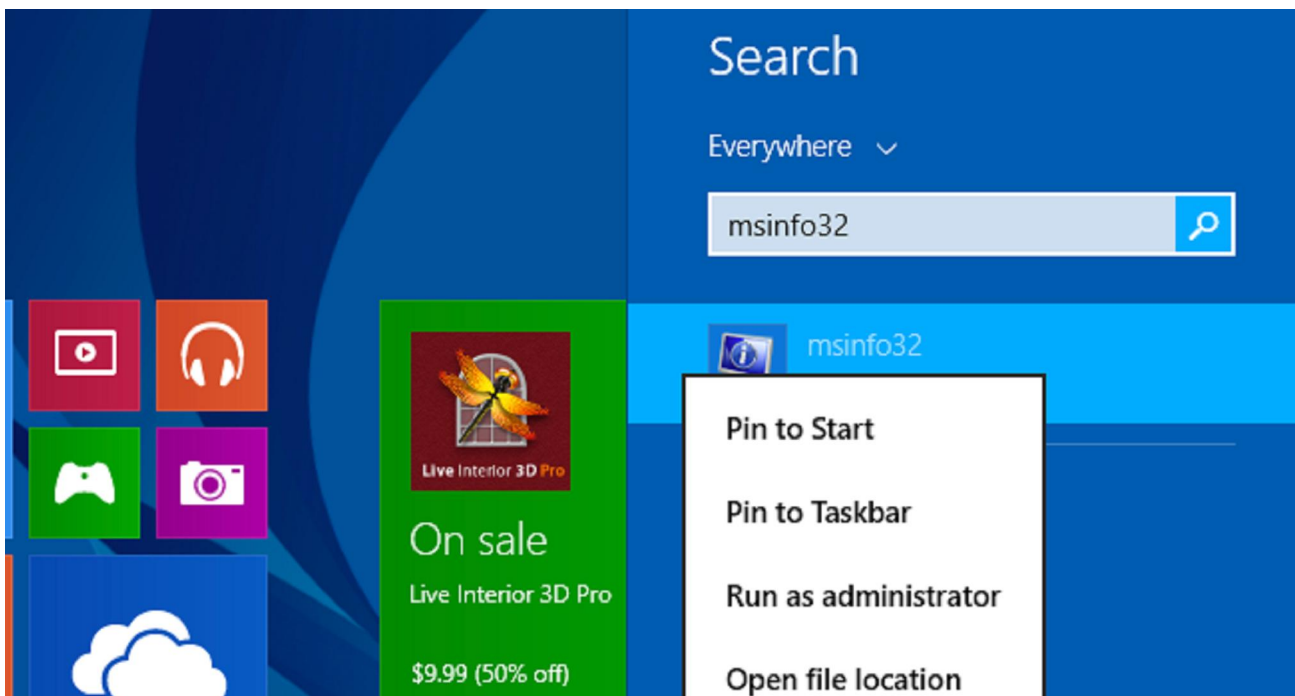

Hit the Enter key, and you'll immediately see the System Information panel.

You can also type *msinfo32* into the Start Screen to bring up the Search, and then you'll finally find it.

You can also right-click on it there and pin to the Start screen or taskbar if you choose.

You can also find the executable under the `\Windows\System32` directory.
